FREE KIT

Passive isn't effort-free. It's effort-shifted.

What actually counts as passive, the first stream to build, and the front-load order, so you build the right thing in the right sequence.

02 The first stream to build

03 The front-load order

01

What genuinely counts as passive

The test is simple: does it keep working when you stop touching it? The effort is real. It's just paid up front, once, instead of every time.

Digital products

BUILD ONCE
Sold again and again

WORKS VIA
A checkout link

Affiliate content

BUILD ONCE
Recommends for years

WORKS VIA
Evergreen search

Resellable products

BUILD ONCE
Keep most of the sale

WORKS VIA
Your own link

Content itself

BUILD ONCE
Keeps sending traffic

WORKS VIA
The products it points to

What quietly isn't: a service you deliver yourself. The moment you stop, it stops.

02

The first stream to build

Start with a single digital product. Not five streams. One, all the way through: made, listed, sold once. Only a finished stream shows you what actually works, and the second is easy once the first has taught you the pattern.

Why a digital product goes first:

- ☐ It's the fastest asset to build, and it's finite
- ☐ It's yours, and it sells on a checkout link
- ☐ It needs no audience to start
- ☐ It teaches you the whole model in one cycle, before you stack anything on top

Make one thing that solves one problem. That's your first stream, and the one that teaches you every stream after it. When it's done, the next move is a related asset for the same buyer: a second product, an affiliate recommendation, a bundle. Each new piece builds on the trust the first one earned.

A CLEANER WORD: LEVERAGED

You're not avoiding work. You're making one piece of work pay off more than once. Build one asset → learn who actually bought it → build the next thing that buyer needs → point the same traffic at both.

One completed stream teaches you more than five half-built ones.

03

The front-load order: asset, home, traffic

Each piece depends on the one before it. Traffic to nothing is wasted. A checkout with no product is empty. Build them in sequence, and resist doing all three at once and finishing none.

1. **The asset.** The product or content that does the work, built once.
2. **The home.** A checkout or page where the sale happens.
3. **The traffic.** Evergreen search that keeps finding it.

My asset: **[the one thing I'll build, and the one problem it solves]**
Its home: **[the checkout link or page where it's sold]**
Its traffic: **[the pins and content I'll point at it]**

THE PART THAT STAYS MANUAL, FOR A WHILE

The asset is passive. Feeding it isn't, at first. Early on you're still making the pins and content that send people to it. That fades as your evergreen content builds up and starts doing the finding for you. The goal isn't zero work on day one. It's less work every month.

The common mistake: chasing traffic before the asset exists. That's building the queue before the shop. And expect a lag between the building and the paying. Patience through the quiet stretch is part of the work.
