
Your storefront, your style

CURRENT SETUP UPDATE · 7 OCTOBER 2026

Read this update before the Preparation and Setup guides. It supplements the older PDFs; the current numbered text files contain the full revised instructions. Adding this sheet does not certify a connection or authorize publishing.

Basic means the shopping list

Select the linked products first, using the saved recipe's item count. The basic flatlay contains only those products: no unlinked jewelry, phone, watch, flowers or other styling props. A pair of shoes is one product. Use a simple surface adapted to the client's survey, clear spacing and recognizable product shapes.

Styled means a finished personal look

Keep the same linked products. Add wearable accessories and everyday belongings that fit the client, outfit and occasion. Match the client's preferred styling density: a maximalist needs a visibly richer composition. Choose details from the whole profile, not just a repeated handful of examples. Use a signature setting that makes physical sense, such as an outfit arranged on a bed with coordinated bedding. Clothing does not belong across a working desk.

Make the scene believable

Lifestyle images show the same outfit worn in a specific, plausible setting. Personalize architecture, colors, landscaping, useful objects and activity from confirmed client preferences. Rotate suitable activities and locations instead of repeating one scene. Do not claim an invented setting is the client's actual home. Props must belong where they appear.

Keep product details and exclusions intact

Use permitted item references. Preserve front/back details, construction, proportions and color. Fold jeans back-up to reveal rear-pocket details; never move those details to the front. Apply the client's exclusions to every object and background. For this Tommy Kate mock: no added decorative bows or ribbons, hydrangeas, furry rugs or gaming headset. Accepted exceptions belong only to their recorded mock, not future clients.

Prompt and design check

Every image prompt must stay under 3,000 characters. Compare basic and styled at thumbnail size: the difference must be obvious. Headlines must be readable; graphics and dark lettering must stay crisp. Adapt blog decoration, color and typography to the client while keeping reading and shopping clear.

Connections that earn a pass

Choose your path

Either ChatGPT or Claude can guide setup, organize supplied product facts and draft copy. Each external tool must be tested in the chosen account and runtime. For a mixed workflow, name one lead assistant and one operator per write, and hand over current records and returned service IDs. Ordinary chat access does not prove unattended execution.

Save time or save credits

Time-saving path: use permitted connections only after the relevant tests pass. Credit-saving path: select products and obtain authorized links manually, provide the checklist, run image generation yourself and schedule approved assets by hand. Keep a manual alternative for every automated or credit-heavy step. A blocked tool does not authorize an upgrade or a paid retry.

Amazon API setup

Read 16_AMAZON_CREATORS_API_CHECK.txt for the current policy check and official source links. Eligibility alone does not prove account access or permission for AI processing. Test catalog access, permitted processing, protected credentials, refresh rules and correct destinations separately. Do not paste private keys into chat or share the founder's key. Do not download API product photos for generation references. Use owned or appropriately licensed references.

Draft, scheduled and published are different

Verify the owning service's returned fields and object ID after a write. A private draft proves a bounded draft handoff only. Publishing and independent scheduled execution need their own evidence. Keep private tests excluded from production, downstream Instagram triggers and blog deployment.

Pull requests need verified removal

Use the tested cancellation route, then read back the owning service to verify removal. If the connected tool cannot cancel, use a verified official planner route or report the remaining action for manual completion. An interactive browser cancellation does not prove unattended cancellation. Preserve unrelated posts and never recreate a removed test.

One record, no repeated setup

Save approved preferences, exclusions, exact products, asset versions, costs, service IDs and results as you go. Record what passed, what failed and what remains unverified separately. Resume from that checkpoint. Keep future interface plans separate from supported features and public release claims.
