

BEGIN HERE

# Your Storefront buyer guide

## What you will make

A complete Pinterest Pin from your selected products: an original or rights-cleared image, accurate copy, a working destination and a posting time you approve. Optional connected tools can prepare the work. You remain in control of each publication.

## Two documents, one clear path

Read this guide first. Use the companion workbook to copy the setup and recipe prompts, fill your account settings, record products, review Pins and track results. The workbook is an editable PDF: open it in a PDF reader that supports forms, save a copy, then type in the response fields. Print it if you prefer handwriting.

## Start without extra subscriptions

For the simplest route, select one look yourself, use your own or licensed photo or original layout, write the copy and schedule in Pinterest. Your existing Claude or ChatGPT plan can help with small requests within its limits. AI, paid schedulers and developer applications are optional.

## Your first session

1. Choose your operating mode. 2. Check your account and public destination. 3. Complete one product intake. 4. Make one finished Pin. 5. Review and schedule it. 6. Reopen the saved record and log the result.

## Where to find things

Guide pages 3-9: the seven setup steps. Pages 10-11: optional paths and references. The remaining pages explain a complete themed look, image choices, recovery and optional additions. Workbook: setup prompt, recipe prompt, task prompts and editable worksheets.

START WITH THE PATH THAT SUITS YOU

# The While-You-Sleep Storefront

## **Your product choices. Your approval.**

Turn your prepared Amazon product selection into original styling images and Pinterest Pins linked to an eligible Idea List or your live shop-the-look page. You review each finished Pin before publication.

## **Time-saving path**

Use supported connected tools to prepare images, copy and a queue. Publishing is optional, account-specific and tested. Your exact finished Pin, destination, board and posting time need your approval.

## **Low-cost Claude or ChatGPT path**

Use the plan you already have for a short planning or copy request, within your limits. Generate one image only if that feature and commercial use are available. No paid scheduler is required.

## **Manual alternative**

Choose products yourself, use your own or licensed asset or original layout, write the fields, and use Pinterest native scheduling. AI and paid automation are optional.

## **Before you begin**

Use the account checklist in the workbook. This guide and the workbook contain everything in the buyer package. No sales, account approval or unattended result is promised.

**STEP 1**

# Check your Amazon path

## **Associates and Influencer are distinct**

Influencer is part of the Associates Program and adds eligibility and storefront/content features. Record your Associates and Influencer status separately. Influencer status does not replace the Associates disclosure.

## **Check the account you actually have**

Verify Storefront and Idea List access separately. Amazon changed creator Storefront wording in April 2026, so do not assume a universal Influencer-only rule or promise every Associates account the same features.

## **Destination**

Use an existing eligible public Idea List when supported. Otherwise use your compliant live website page and your own Special Links. Test public visibility separately from the owner view.

## **Low-cost Claude or ChatGPT**

Give chat your selected product facts and request one list title and description. Do not ask it to invent an ASIN, link or entitlement.

## **Manual alternative**

Choose products, capture your own Special Links, create the Idea List and record its exact URL yourself. Keep registered sites and social profiles current, finish the save and read the result back.

## STEP 2

# Create persistent working state

## One production workspace

Manual mode: the workbook can hold your settings, intake, queue and log. Save a private copy and a backup. Connected automation may need separate working files; the setup prompt creates them from your answers. Those files are working state, not extra buyer instructions. Keep this project separate from other TDIE automation.

## Record what is known

Save your theme, timezone, exact public board and section, Amazon destination, image provider/model, rights evidence, maximum image budget, runtime and publishing method. Leave unverified choices UNKNOWN.

## Local or cloud

A local runtime needs the configured host available. A cloud runtime needs state and connections accessible in that cloud environment. Prove read/write persistence with a draft-only run. A local folder is not automatically cloud state.

## Low-cost Claude or ChatGPT

Copy the setup prompt from the workbook into a chat. Ask it to format your answers and draft the state files; verify the saved content yourself.

## Manual alternative

Fill the same settings and queue fields in text files. No scheduled task is required. Browser locking is only relevant where work actually shares a browser.

## STEP 3

# Prepare a ready product intake

## One look, one destination

Start with one coherent selection. Complete the product worksheet in the workbook for each item: ASIN, your description, color/material, your Special Link, destination URL and image rights. Connected automation uses the same information in its product intake file.

## Customer-owned Amazon work

The default agent reads your prepared intake. It does not create Amazon links or lists, browse as a disguised person, or invent missing product data. An approved integration is optional and requires independent eligibility.

## Image rights

Use written attributes, customer-owned images or an explicit license covering transformation and commercial use. Public Amazon product photographs and paid classroom access do not automatically supply those rights.

## Low-cost Claude or ChatGPT

Ask chat to organize one look from facts you supply. Keep requests small and reject any invented link, product detail or rights claim.

## Manual alternative

Choose the items and write the intake table yourself. Missing information means HOLD. Complete the row before generating images or preparing a publication.

STEP 4

# Make and inspect your image

## Optional time-saving route

Use only the provider/model and connector verified on your account. Website Unlimited is not proof of connector or API Unlimited. Set a spend limit before generation.

## Inspect the actual asset

Check product count, color, fabric, hands, framing, logos and spelling. Persona references need consent and rights. A person-free flat lay or collage is a normal option.

## Low-cost Claude or ChatGPT

Use one selected generation if available within your plan limits and commercial terms. Fix only the failed asset. Keep a valid companion image.

## Manual alternative

Use your own photograph, licensed image or original layout. Add readable text in your normal editor. No AI generation, provider subscription or persona is required.

## Represent it honestly

Describe generated styling as inspiration, not product photography. If the linked list contains similar pieces, say so. Use applicable Pinterest AI-content and AI-person labels.

STEP 5

# Write a finished Pin record

## Required fields

Save the image, accurate title, caption, alt text, exact destination, public board/section and intended date/time in the queue. A stable ID ties the look, Pin number and timestamp to its external record.

## Kit copy rules

Title: 60-100 characters. Caption: 450-500 characters. Use generic item descriptions, no prices, and no product brand, film or character names. Alt text describes what the image actually shows.

## Disclosure

Begin the caption with #ad. End it with: As an Amazon Associate I earn from qualifying purchases. Place the required statement prominently on the linked social account/profile too. Influencer is your account status; Associate is the required program disclosure.

## Low-cost Claude or ChatGPT

Request one title, caption and alt text from verified intake and the actual image. Count characters and read every field before approval.

## Manual alternative

Write the same fields yourself from this checklist. Confirm that the caption explains AI styling and similar-product destinations accurately. Approval of one record does not approve later Pins.

STEP 6

# Schedule only the approved Pin

## Manual is the default fallback

In Pinterest native composer, upload the finished image, paste the approved fields, choose the exact public board and set the approved date/time. Review before confirming. Then reopen the saved record.

## Optional connected publisher

A supported approved connector, Metricool or developer API is a separate account test. Verify access, board resolution, media, link, alt text, approval and schedule. Missing capability means BUILD/QUEUE ONLY.

## Individual approval

Approve the exact finished image, copy, destination, board and date/time. Missing approval means HOLD. A withdrawn date never becomes a substitute date automatically.

## Low-cost Claude or ChatGPT

Have chat prepare a compact field checklist. Schedule it yourself in the native interface; no developer application or paid scheduler is needed.

## Manual alternative

Review and schedule each Pin yourself. Record its exact external ID and service. Native Pinterest and Metricool are separate inventories; check both before creating another record.

STEP 7

# Reconcile before you retry

## Read back first

Match the exact external ID, image, title, caption, destination, board and posting time. Mark passed only when observed. Save evidence and the result in storefront-log.md and pin-tab.md.

## Failure or timeout

Preserve completed work and check the external service before retrying. Do not create a duplicate stable ID, replace a date, change a model or buy credits automatically.

## Withdrawal and PULL

HOLD stops new publication. PULL is a requested removal/change, not permission to publish. Confirm any change by external readback. Draft status alone is not proof that all automatic publishing settings are disabled.

## Low-cost Claude or ChatGPT

Give chat the current scheduler statuses for one comparison. Ask it to identify unknowns and the exact next action.

## Manual alternative

Inspect native Pinterest and Metricool separately and update the log yourself. Verify a public destination while signed out when possible. Owner-session visibility is a separate result.

OPTIONAL ADDITIONS

# Add only what you need

## Scheduled work

The workbook supplies weekly planning, optional permission-gated OOTD and reconciliation templates. They are not installed tasks or proof of a run. Use your confirmed timezone and actual schedule.

## Blog half

Prepare an original page from verified intake. Low-cost chat can draft one page; manually paste it into your editor. A supported site connector is optional. Confirm the live page before linking a Pin.

## Brand Closet OOTD

Keep this disabled until paid-content rights, access and the recipe permission gate pass. Low-cost chat can use your own original styling brief. Manual alternative: make your own look and skip paid content.

## Instagram and referrals

Keep these separate from the core workflow. Verify current program access and disclosure. Do not put earnings claims on Facebook or Instagram. Scheduled affiliate availability is not evidence that it is live.

## Upgrade only a real bottleneck

Compare actual volume, plan allowance and time saved. Each core step includes a low-cost chat route and a fully manual route. Test before claiming it works.

VERIFICATION AND REFERENCES

# What counts as ready

## Account checklist

Associates/Influencer capabilities, registered traffic sources, public destination, exact public board, state persistence, image rights and budget, approved Pin fields and publishing method all need evidence.

## Historical example

The project includes earlier Halloween and OOTD examples. They illustrate styling, not current release readiness. Reverify their account, board, rights, links and schedule before using any result as proof.

## Amazon agreement and disclosure

<https://affiliate-program.amazon.com/help/operating/agreement>

<https://affiliate-program.amazon.com/help/node/topic/GPXFHVVZMTGPUMPE>

## Amazon program and change notice

<https://affiliate-program.amazon.com/help/operating/policies>

<https://affiliate-program.amazon.com/help/operating/compare>

## Pinterest requirements

<https://policy.pinterest.com/en/developer-guidelines>

<https://policy.pinterest.com/en/terms-of-service>

## Policy vs account proof

References checked September 30, 2026. Official rules explain requirements. Your current account and a read-back test establish capability. Use the official links on this page; record unresolved checks and the next action.

MAKE YOUR FIRST LOOK

# Build one look from beginning to end

## Choose a useful theme

Pick one specific situation, such as pink workwear for a cold office. Select the products yourself and create or confirm the eligible public Idea List or your own published look page. Put one item on each product worksheet. Never mark an example or missing link ready.

## Make one image first

Use a flat lay, person-free collage, your own photograph or a licensed asset. Two variations are optional: one flat lay and one different layout or a rights-cleared persona scene. Start with one valid Pin when you want to save credits.

## Inspect before writing

Confirm item count, colors, silhouettes, fabric, hands where applicable, portrait framing and readable overlay text. Remove unintended logos or decorative third-party characters. An AI styling image is inspiration; similar products in a list are not the exact items photographed.

## Finish all fields

Write the title, caption and alt text using the rules in Step 5. Confirm the image, destination, board, section and date. Put the complete record on the Pin review worksheet. An unfinished record stays HOLD.

## Approve and read back

Choose each exact Pin yourself before publishing. Schedule in Pinterest or a tested supported publisher. Reopen the external record and compare all fields. Copy its external ID to the log. Check native Pinterest and Metricool separately before making another Pin.

## YOUR ROUTES

# Save time or save credits at every stage

### Planning and product choices

Time-saving: a tested runtime organizes your approved intake. Low-cost chat: give one short request using your own notes. Manual: choose a look, find the products and create your own links and destination in Amazon.

### Images and corrections

Time-saving: a verified image connector uses the chosen model within your budget. Low-cost chat: request one image only if your account supports it and its commercial terms fit. Manual: use an original layout, your own photo or a licensed asset. Correct only the failed image; keep valid work.

### Copy and destination

Time-saving: supported tools prepare fields or an authorized website page. Low-cost chat: ask for one title/caption/alt-text set or one page from verified facts. Manual: write the fields and create your Idea List or paste a page into your site editor.

### Queue and scheduling

Time-saving: tested tools save the complete record and publish only after the required individual approval. Low-cost chat: prepare and check fields, then schedule yourself. Manual: review every field in Pinterest and set your chosen posting time.

### Readback and changes

Time-saving: supported tools inspect existing records and update the log. Low-cost chat: paste statuses for one comparison. Manual: open each owning service and match the exact external ID. A timeout is a reason to check first, not create a duplicate.

## IMAGE CHOICES

# Choose a provider you can actually use

### Use your own account evidence

Record provider, model, interface, allowance, commercial rights and maximum spend in the workbook. A website allowance can differ from a connector or API allowance. Another person's subscription does not transfer to your account.

### With a persona

Use a reference only with consent and rights covering transformation and commercial use. Check likeness, hands, fabric and framing. Keep the persona optional; a person-free layout is a complete path.

### Without image generation

Use your own photograph, a licensed image or a layout you create in your usual editor. The workflow does not require a paid image provider. Choose the applicable AI-content and AI-person labels based on the actual finished image.

### Limits before spending

Set your maximum cost before generation. Use no more than the first attempt and two correction rounds per Pin, within that budget. If the asset still fails, hold it. Do not switch plans or models silently.

### A short image brief

Use the recipe prompt in the workbook. Describe verified colors, fabrics, shapes and arrangement in your own words. Supply no copied marketplace image unless you have the necessary rights. Review the exported asset before it enters the queue.

**KEEP WORK RECOVERABLE**

# Track results without duplicating Pins

## **One record for each Pin**

Use a stable ID made from the look, Pin number and chosen date/time with timezone. Save that ID, the owning service and its external ID. If the date changes by your instruction, retain the old ID and mark it withdrawn; create a new record only after checking the old external record.

## **When a run stops**

Save completed assets and fields. Mark the unfinished step and the exact reason. Read the external scheduler before retrying. Resume only after the missing capability is restored and the required approval is still valid.

## **If authorization expires**

Stop connected publication, mark waiting for Pinterest authorization and reconnect through the normal service flow. Use the manual route if you choose. Never invent a hidden browser or private-request workaround.

## **If a product or link fails**

Mark blocked product or blocked destination. Choose a replacement yourself and verify it. Do not let chat invent a link, ASIN or substitute posting date.

## **HOLD and PULL**

HOLD means do not publish. PULL records your requested change or removal of the exact existing item; it does not itself prove the external change happened. Read the record back and log the observed result. Missing approval always stays HOLD.

## OPTIONAL PUBLISHING

# Use connected scheduling only after a test

## Choose the simple path first

Native Pinterest scheduling needs no developer application. Metricool is optional and requires its own account test. A developer app is a separate route; check current approval, authorization scopes and supported operations in the official portal.

## A useful draft-only test

Use one prepared image and complete fields. Confirm the chosen account, public board, destination, alt text, approval and intended date. Save as a draft with automatic publishing disabled, then read it back. Do not call publication or scheduling passed based on a draft-only test.

## For a developer application

Prepare a demo of the real workflow: connect, select the exact board, prepare a finished Pin, have the customer choose each Pin, submit only a supported request and read the result back. Keep credentials out of prompts, logs and public files. Test access is not proof of production capability.

## Low-cost and manual routes

Ask your existing chat to organize application notes if you need them. Otherwise skip the application and schedule each Pin yourself. While a required capability remains unknown, use build/queue only.

## For scheduled work

Copy the relevant task prompt from the workbook. Supply a confirmed timezone, schedule, accessible state and supported tools. A template is not an installed task. Test the actual environment before enabling recurring work.

OPTIONAL ADDITIONS

# Add a website or another channel

## Your look page

Publish an original title, introduction, rights-cleared styling image, your own Special Links, affiliate disclosure and an accurate AI-image disclosure. Check the live page before linking a Pin. Do not include prices in this kit's Pin or image copy.

## Low-cost website path

Ask your existing chat for one page draft from the verified product intake. Read it, check every link, and paste it into your site editor.

## Manual website path

Write the same page yourself and publish through your usual editor. A supported site connector is an optional time-saving route; it still needs live readback.

## Instagram

Treat Instagram as a separate optional workflow. Check current account features, disclosures and publishing rules. Low-cost chat can draft one caption; manually create the post in the app or your normal publishing interface. Do not put earnings claims on Facebook or Instagram.

## Keep the core simple

Your first complete Pinterest workflow does not need a website if your eligible public Idea List works. It does not need Instagram, a persona, developer approval or a paid scheduler.

OPTIONAL STYLING SOURCE

# Keep paid community material separate

## Brand Closet OOTD

This optional route stays disabled until you have written permission covering the intended commercial derivative and automated use of paid material. Membership or referral access is not evidence of that permission.

## Permission to record

Confirm permitted access, extraction of product attributes, prompt transformation, derivative styling images, commercial publication, affiliate use, automated processing, customer use and the permission's duration and revocation conditions. Keep the actual permission privately.

## Low-cost alternative

Give chat your own original styling brief and verified product facts. Use a small request on your existing plan. Skip paid content when rights are uncertain.

## Manual alternative

Create an original look from your own notes, select your own products and links, make a rights-cleared asset and schedule in Pinterest. Do not copy paid lesson text, reuse paid images or assume a community instruction grants a commercial license.

## Optional referral card

Only use a program you personally have access to under its current terms. Verify membership information and referral conditions before publishing. A manual website card is sufficient. Referral permission does not activate the OOTD automation.

FINISH YOUR FIRST TEST

# Know what passed and what is still unknown

## Ready for one approved Pin

Your intake is complete; rights and budget are recorded; the public destination works; the exact public board is chosen; image and copy pass review; date/time is yours; the finished Pin has your individual approval.

## Pass only what you observed

Owner-visible lists are not the same as signed-out public access. A saved draft does not prove scheduling. A scheduled Pin does not prove it published at the right time. A document on your computer does not prove a cloud run can read it.

## Record the next action

Use the test log in the workbook: expected result, observed result, pass or unverified, evidence and next action. Keep historical tests separate from current ones.

## Start again from a saved record

Before the next look, check the current queue, external schedules and unresolved holds. Reuse valid work. Add automation only where a repeated task justifies it.

## You have the complete buyer package

Keep the guide for instructions and a private saved workbook for your settings, prompts, products and Pin records. Working state files are needed only if your chosen automation uses them; the setup prompt will prepare those from your answers.
